

As of April 2016, there is insufficient information to determine the site-wide Human Exposure Control status at the Wilcox Oil Company Superfund Site.

The Site was finalized on the NPL December 12, 2013, and there has been no evaluation of the human health exposure indication yet. This does not necessarily mean that unacceptable exposures are occurring.

As of April 2016, the planned activities to collect sufficient information to make a human exposure evaluation are Phase 1 field screening and Phase 2 field investigation planning including the collection of data that can be used to evaluate potential human exposure to soil, sediment, surface water, ground water, and vapors.

Properties of concerned residents were sampled in May/June 2015. Soil data from the residential areas was reviewed to assess the potential for immediate human health risks. All results and concerns were discussed with the residents in October 2015. At this time, no immediate health risks were identified. In addition, properties where refinery waste is present at the surface are fenced and locked to deter trespassing and potential contact with the refinery waste.
